A review on pharmacognostic and phytochemical study of a plant *Spilanthes acmella* Murr.

Mohammad Arif, Dr. Divya Juyal and Amit Joshi

**Abstract**
Genus *Spilanthes* is widely distributed in tropical and subtropical regions of the world. *Spilanthes acmella* Murr. is a potent medicinal plant, belongs to the family Asteraceae. The plant is used in traditional system of medicine for healing various diseases. This study comprises morphological, macroscopy, microscopical, pharmacodynamics and pharmacognostic investigations of the plant. It’s multiple traditional use and pharmacological responses allow us to write a review of *Spilanthes acmella*. This review will give all the scientific information in a brief manner to the scientific community.

**Keywords:** *Spilanthes acmella*, macroscopy, microscopical, phytochemical and pharmacognostic

**1. Introduction**

**1.1 Role of herbal medicine**
The world health organization (WHO) estimates that 80% of the population of some Asian and African countries presently uses herbal medicine for primary health care. Medicinal plants play an important role in the development of potent therapeutic agents. Currently herbal medicine is very much in demand and their popularity is increasing day by day. Herbal drugs referred as plant materials or herbals, involves the use of plants, to treat injuries or illness. A medicinal plant is any plant which, in one or more of its organ, contains substances that can be used for therapeutic purposes, or which are precursors for chemical, pharmaceutical and semi-synthetic purpose [1].

Herbal medicines are the oldest remedies known to mankind. Herbs had been used by all culture throughout associated with the use of medicinal plant. In the present scenario, the demand for herbal product is growing experimentally throughout the world and major pharmaceutical companies are currently conducting extensive research on plant materials for their potential medicinal values. Standardization of herbal formulation is essential in order to access of quality drugs, based on the concentration of this active principle, physical, chemical, hypo-chemical, standardization and in-vitro, in-vivo parameters.

**1.2 Advantages of herbal drugs**
- Cost effective
- Easy accessibility
- Less side effects
- Safe [1].

**2. Plant introduction**
Genus *Spilanthes* belongs to family Asteraceae which is widely distributed in tropical and subtropical regions of the world. The plants of this genus are reported in some regions of India such as South India, Chhattisgarh and Jharkhand. The plant grows naturally in damp areas, near sewage discharge areas, near lakes or ponds. It is commonly known as toothache plant, eyeball plant, paracress and spot plant. There are around 60 species of genus *Spilanthes* which have been reported from different areas and regions of the world. From all of these 5 species occur in India namely *S. acmella* Murr., *S. acmella* L. var. oleracea Clarke, *S. calva* L., *S. calva*, *S. paniculata*, and *S. mauritiana* L. from all these species *S. acmella* is an acutely threatened species. In some of literature survey genus *Spilanthes* also mentioned as *Acmella* [2].

*Spilanthes acmella* is a vital medicinal plant commonly known as akarkara plant with rich source of therapeutic constituents. By chewing the leaves or flowers, it produces a numbing...
effect to the tongue and gums so it is called as toothache plant. Flower heads and roots are used in treatment of scabies, psoriasis, scurvy, and toothache, infection of gums and throats and paralysis of tongue \cite{2}. The leaves contain important phytoconstituents such as alkamides (Spilanthol), which is responsible for the trigeminal and saliva inducing effects of products, isobutylamide derivatives, \( \alpha \) - and \( \beta \)-amyrin esters, amino acids, stigmasterol, triterpenoid saponins, and alkaloids. The plant has been used as anti-inflammatory and analgesic, anesthetic and antipyretic, bio-insecticides and as remedy for rheumatism, and infection of gums and as immunostimulant \cite{3}.

Fig 1: Figure depicting the plant in flowering stage, a single flower, and a plant in its natural habitat, crude powder form and seeds of the plant \textit{Spilanthes acmella}.

2.1 History

\textit{Spilanthes} having two species was first described by Jacquin (1760), \textit{Spilanthes insipida} and \textit{S. urens}. Richard (1807) described \textit{Spilanthes} in having ray florets and lack of pappus which differ \textit{Acmella} as a genus of five species. Cassini (1822) suggested that \textit{Acmella} might be treated better as a section within \textit{Spilanthes}. De Candolle (1836) followed Cassini’s suggestion and recognized two sections, namely \textit{sect. Salvaria} DC. Still some of the Indian treatises \textit{Ramsewak et al. 1999, Saraf & Dixit 2002, Shefali Arora et al. 2011, Kishan et al. 2011, Veda et al. 2012, Anuradha Sharma et al. 2012}) have followed the broader concept of the genus \textit{Spilanthes} \cite{4}.

3. Pharmacognostic Profile

3.1 Taxonomical classification

3.3 Pharmacognostic evaluation

3.3.1 Macroscopy
It is an annual herb and is short lived that is 40-60 centimeters tall. Mainly grown in damp area and has low rate of germination and poor vegetative propagation. Its flowers and leaves have pungent taste but when cooked, the plants lose their strong flavor and may be used as a green leafy vegetable. *Spilanthes acmella* is synonym with *Spilanthes oleracea*. *Spilanthes acmella* is a very beautiful, erect or ascending stout herb, and can be grown as an annual plant in most climates of the world. A small, erect herb grows swiftly and flourishes with gold and red floral inflorescences. It can be grown in the ground or as a potted herb. A rich soil with compost is suitable the temperature of about 70 °F is suitable [6]. Leaves are opposite, acute or obtuse at apex, petiolate, broadly ovate, narrowed at base, flowering and fruiting in March-April. *Spilanthes acmella* L [7].

3.3.2 Chemical constituents [6, 7]
The major pungent constituent reported in this plant *S. acmella* is “spilanthol,” which is an isobutyramide having insecticidal properties. Spilanthol is chemically N-isobutylamide which is bitter in taste and could stimulate salivation.

3.3.3 Bioactive metabolites

Major isolates were lipophilic alkylamides or alkamides bearing different number of unsaturated hydrocarbons (alkenes and alkynes), such as spilanthol or affinin (2E, 6Z, 8E)-N-isobutyl-2, 6, 8-decatrienamide and amide derivatives. Alkamides are structurally related to animal endo cannabinoids and is highly active in the central nervous system [9].

7. Conclusion

*Spilanthes acmella* is a plant of choice for many health related disorders. It is used traditionally in many diseases. There are many phytoconstituents which shows vital pharmacological activity, the active ingredient spilanthol is proposed to be responsible for most of its biological activities. There are many alkamides and secondary compounds reported from the plants. The review shows the activity of various parts of the plant and its pharmacognostic profile. Extracts and phytoconstituents isolated from this plant have shown to produce different pharmacological response, which includes diuretic, analgesic, anti-inflammatory, vasodilation, anti-inflammatory and antimalarial effects. The most traditional use of this plant is to reduce toothache all over India as well as South America. Other traditional uses of *Spilanthes acmella* are as antidiarhoeal used rarely against tuberculosis, stomachic and stimulant.
