Development of various functional food components in health aspects

Pukhraj Meena

Abstract
Numerous bioactive components isolated from legumes, cereals, grains, fruits and vegetables have been shown to be efficacious in reducing lipid and cholesterol levels, increasing bone mineral density and antioxidant status as well as possessing anticancer properties. Cereals contain water soluble fiber, such as beta-glucan and arabinoxylan, oligosaccharides, such as galacto and fructo-oligosaccharides and resistant starch, which have been suggested to fulfill the prebiotic concept. The idea of using food for health purposes rather than for nutrition opens up a whole new field for the meat industry. The future viability and success of functional foods in the market place depend on several elements i.e., consumer acceptance of such products on specified cost.

Keywords: anticancer properties, resistant starch, beta-glucan & consumer acceptance.

1. Introduction
The primary role of diet is to provide enough nutrients to meet metabolic requirements, while giving the consumer a feeling of satisfaction and well-being. Recent knowledge, however, supports the hypothesis that, beyond meeting nutrition needs, diet may modulate various physiological functions and may play detrimental or beneficial roles in some diseases. Now concepts are expanding from the past emphasis on survival, hunger satisfaction, and preventing adverse effects to an emphasis on the use of foods to promote a well-being state, improving health, and reducing the risk of diseases. These concepts are particularly important for increasing cost of health care, the steady increase in life expectancy and the desire of older people for improved life quality.

Functional food is a recent concept that originated in Japan but was further developed in the United States, Europe and other parts of the world. This concept implies that foods and food components have the ability to beneficially influence body functions to help improve the state of well-being, health and reduce the risk of diseases. The market of these products is significant. In total, more than 1700 functional food products have been launched in Japan between 1988 and 1998 with an estimated turnover of around 14 billion US$ in 1999. The market was estimated to be 5 billion US$ in 2003 (Side, 2006) and 5.73 billion US$ in 2006, while more than 500 products were labeled as FOSHU in 2005.

From a practical point of view, a functional food can be
- A natural food in which one of the components has been naturally enhanced through special growing conditions.
- A food to which a component has been added to provide benefits (e.g. the addition of selected probiotic bacteria with proven health benefit characteristics to improve gut health).
- A food from which a harmful component has been removed so that the food has less adverse effects on health (e.g. the reduction of saturated fatty acids [SFA]).
- A food in which the nature of one or more components has been chemically modified to improve health (e.g. the hydrolyzed protein in infant formulas to reduce the likelihood of allergenicity).
- A food in which the bioavailability of one or more components has been increased to provide greater absorption of a beneficial component.
- Any combination of the preceding possibilities.
Functional foods are similar in appearance to conventional foods; the former being consumed as part of the normal diet. In contrast to conventional foods, functional foods, however, have demonstrated physiological benefits and can reduce the risk of chronic disease beyond basic nutritional functions, including maintenance of gut health [8]. When food is being cooked or prepared using "scientific intelligence" with or without knowledge of how or why it is being used, the food is called "functional food". Functional foods may improve the general conditions of the body (e.g. pre and probiotics), decrease the risk of some diseases (e.g. cholesterol-lowering products), and could even be used for curing some illnesses.

2. Development of Functional Foods

Functional food development implies the incorporation of specific bioactive compounds with positive physiological effects [10]. There are different technological strategies that modify food composition to accomplish health improvement by adding those bioactive compounds [5]. Most bioactive compounds characterized as nutraceuticals are derived from plants.. Hundreds of plant-derived nutraceuticals that have been identified, few have been incorporated into common foods for habitual consumption. Table 1 shows different functional components with their source and benefits.

<table>
<thead>

## The Pharma Innovation Journal

### Phenolic acids
- **Caffeic acid, Ferulic acid**
  - Apples, pears, citrus fruits, some vegetables, whole grains, coffee
  - Cellular antioxidant defenses; supports maintenance of eye and heart health

### Plant stanols/sterols
- **Free Stanols/Sterols**
  - Corn, soy, wheat, fortified foods and beverages
  - May reduce risk of CHD
- **Stanol/Sterol esters**
  - Stanol ester dietary supplements, fortified foods and beverages, including table spreads
  - May reduce risk of CHD

### Polys
- **Sugar alcohols**
  - Xyitol, Sorbitol, Mannitol, Lactitol
  - Some chewing gums and other food applications
  - May reduce risk of dental caries

### Prebiotics
- **Inulin, Fructo-oligosaccharides (FOS), Polydextrose**
  - Whole grains, onions, some fruits, garlic, honey, leeks, banana, fortified foods and beverages
  - Supports maintenance of digestive health; supports calcium absorption

### Probiotics
- **Yeast, Lactobacilli, Bifidobacteria and other specific strains of beneficial bacteria**
  - Certain yogurts and other cultured dairy and non-dairy applications
  - Supports maintenance of digestive and immune health; benefits are strain-specific

### Phytoestrogenes
- **Isoflavones – Daidzein, Genistein**
  - Soybeans and soy-based foods
  - Maintenance of bone and immune health, and healthy brain function; In women, supports menopausal health
- **Lignans**
  - Flax seeds, rye, seeds and nuts, lentils, triticale, broccoli, cauliflower, carrot
  - Support maintenance of heart and immune health
- **Soy protein**
  - Soybeans and soy-based foods like milk, yogurt, cheese and tofu
  - May reduce risk of CHD

### Sulfides/thiols
- **Diallyl sulfide, Allyl methyl trisulfide**
  - Garlic, onions, leeks, scallions (Looks like green onion)
  - Enhance detoxification of undesirable compounds; supports maintenance of heart, immune and digestive health
- **Dithiolthiones**
  - Cruciferous vegetables
  - May enhance detoxification of undesirable compounds; supports maintenance of healthy immune function

### Vitamins
- **A**
  - Organ meats, milk, eggs, carrots, sweet potato, spinach
  - Supports maintenance of eye, immune and bone health; contributes to cell integrity
- **Thiamin (Vitamin B1)**
  - Lentils, peas, brown or enriched white rice, pistachios and certain fortified breakfast cereals
  - Supports maintenance of mental function; helps regulate metabolism
- **Riboflavin (Vitamin B2)**
  - Lean meats, eggs, green leafy vegetables, dairy products and certain fortified breakfast cereals
  - Supports cell growth; helps regulate metabolism
- **Niacin (Vitamin B3)**
  - Dairy products, poultry, fish, nuts, eggs and certain fortified cereals
  - Supports cell growth; helps regulate metabolism
- **Pantothenic acid (Vitamin B5)**
  - Sweet potato, organ meats, lobster (Sea Products), soybeans, lentils and certain fortified breakfast cereals
  - Helps regulate metabolism and hormone synthesis
- **Pyridoxine (Vitamin B6)**
  - Beans, nuts, legumes, fish, meat, whole grains and certain cereals
  - Supports maintenance of immune health; helps regulate metabolism
- **Folate or folic acid (Vitamin B9)**
  - Beans, legumes, citrus fruits, green leafy vegetables and fortified cereals, pasta, rice
  - Reduce a woman’s risk of having a child with a brain or spinal cord defect; maintenance of immune health
- **Vitamin B12 (Cobalamin)**
  - Eggs, meat, poultry, milk and certain cereals
  - Supports maintenance of mental function; helps regulate metabolism and supports blood cell formation
- **Biotin**
  - Liver, salmon, dairy products, eggs, oysters and certain cereals
  - Helps regulate metabolism and hormone synthesis
- **Vitamin C**
  - Guava, sweet red/green pepper, kiwi, citrus fruit, strawberries, fortified foods and beverages
  - Neutralizes free radicals which may damage cells; supports maintenance of bone and immune health
- **Vitamin D**
  - Sunlight, fish, fortified foods such as yogurts or cereals, and beverages, including milk and juices
  - May reduce the risk of osteoporosis; helps regulate calcium and phosphorus; supports immune health; helps support cell growth
- **Vitamin E**
  - Sunflower seeds, almonds, hazelnuts, turnip greens, fortified foods and beverages
  - Neutralizes free radicals, which may damage cells; supports maintenance of immune and heart health

The most prominent types of functional products are presented briefly as follows:

### 2.1 Functional Fruits

Apart from traditional fruits, the functional fruits and vegetables like pomegranate, kiwi, Cranberry, Bottle guard, Bitter guard have meticulous health beneficial effects. Some of them are discussed here:

<table>
<thead>
<tr>
<th>Plant component</th>
<th>Constituents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pomegranate juice</td>
<td>Anthocyanins, glucose, organic acid, ascorbic acid, EA, ETs, gallic acid, caffeic acid, catechin, quercetin, rutin, minerals</td>
</tr>
<tr>
<td>Pomegranate seed oil</td>
<td>Conjugated linolenic acid, linoleic acid, oleic acid, stearic acid, punicic acid, elaeostearic acid, catalpic acid</td>
</tr>
<tr>
<td>Pomegranate peel</td>
<td>Luteolin, quercetin, kaempferol, gallagic, EA glycosides, EA, punicalagin, punicalin, pedunculaglin</td>
</tr>
<tr>
<td>Pomegranate leaves</td>
<td>EA; fatty acids</td>
</tr>
<tr>
<td>Pomegranate flower</td>
<td>Polyphenols, punicalagin punicalin, EA</td>
</tr>
<tr>
<td>Pomegranate roots and bark</td>
<td>Alkaloids, ETs</td>
</tr>
</tbody>
</table>

Pomegranate juice exert antiatherogenic, antioxidant, anti-hypertensive, and anti-inflammatory effects.

- Punicic acid, a conjugated fatty acid present in pomegranate has an *in vivo* anti-inflammatory effect by limiting neutrophil activation and lipid peroxidation consequences.
- Pomegranate fruit and derivates endowed with a very high antioxidant activity as an anti-proliferative, anti-invasive, and pro-apoptotic agent in various cancer cell lines and animal models.
- The protective effects of pomegranate poly-phenolics against UVA- and UVB-induced cell death of human skin fibroblasts may be attributed to reduced generation of intracellular ROS and increased intracellular antioxidant capacity.
- Pomegranate peel possesses antibacterial properties. Several studies conducted on aril juice is reported to possess anti-viral activity.

#### 2.1.1 Pomegranate

The health benefits of pomegranate have been attributed to its wide range of phytochemicals, which are predominantly polyphenols, including primarily hydrolyzable ellagitanins, anthocyanins, and other polyphenols. Antioxidant activity of pomegranate has been attributed to its high polyphenolic content, specifically punicalagins, punicalins, gallocatechin gallate and ellagic acid.

#### 2.1.2 Kiwi Fruit

Kiwi fruit is rich in vitamins C, Lutein and Xanthine and exert strong antioxidant activity. It helps to prevent cardiovascular diseases, cancer & insomnia. It improves the iron absorption and digestion.

#### 2.1.3 Cranberry

Cranberry is a rich source of bioactive phenolic compounds with anti-proliferative, antioxidant, anti-inflammatory, and antimicrobial activities. Cranberries contain bioactive compounds such as anthocyanins, flavonoids and tannins. Cranberry has been traditionally used to treat and prevent urinary-tract infections.

#### 2.1.4 Tomatoes

Lycopene is the principal component of the tomato. It exhibits strong antioxidant effects to higher number of conjugative double bonds. Lycopene helps in prevention of prostate cancer and stress induced diseases.

#### 2.1.5 Amla

Amla is a rich source of Vitamin C. Amla enhances food absorption, balances stomach acid, fortifies the liver, nourishes the brain and mental functioning, supports the heart, strengthens the lungs, regulates elimination of free radicals, enhances fertility, helps the urinary system, increases skin health, promotes healthier hair, acts as a body coolant, flushes out toxins, increases vitality, strengthens eyes, improves muscle tone and, acts as an antioxidant. Amla is used for hair lose, eye sight, cardiovascular disease, diarrhea, digestion disorders etc. it possess anti ageing components and helps in mineral absorption.

#### 2.2 Probiotics

Probiotics are defined as “live microorganisms, consumed in adequate numbers for health benefit on the host”. *Lactic acid bacteria* (LAB) and *bifidobacteria*, the most studied and widely employed bacteria within the probiotic field, are normal components of the intestinal microbiota and have a long tradition of safe application within the food industry [14]. This success of dairy probiotics can partly be explained by their general positive image among consumers [17]. Recently, encapsulation was found as possible technology for decreasing sensitivity of probiotics [14, 6]. Fruit juice has also been suggested as a novel, appropriate medium for fortification with probiotic cultures [26].

#### 2.3 Prebiotics

Prebiotics are non-digestible food ingredients that beneficially affect the host by stimulating the growth and/or activity of one or a limited number of bacteria in the colon, thus improving host health. Fructo-oligosaccharide (FOS), inulin, isomalt-oligosaccharides (IMO), polydextrose, lactulose and resistant starch are considered as the main prebiotic components. Oligosaccharides play important role in obesity control [1]. Besides being prebiotics, these compounds have shown to increase calcium absorption, thus improve both bone mineral content and bone mineral density (BMD) [2]. Furthermore, they influence the formation of blood glucose, and reduce the levels of cholesterol and serum lipids [16]. Prebiotics enhance the growth and survival of the probiotic cultures by influencing the growth and metabolites of both the probiotic and the starter. Due to the potential synergy between probiotics and prebiotics, foods containing a combination of these ingredients are often referred to as symbiotics [9].

#### 2.4 Functional drinks

Another important product category within the functional food segment is non-alcoholic beverages fortified with vitamins A, C and E or other functional ingredients.
Although, there is a relatively high number of a product available in this segment e.g. functional drinks are those of cholesterol-lowering drinks (with combination of omega-3 and soy), ‘‘eye health’’ drinks (with lutein) or ‘‘bone health’’ drinks (with calcium and inulin)\[^{[13]}\]. In India, the tea is popular drink among Indian population. In some regions, the tea is incorporated with different spices and herbs which add the nutritional value to tea. Masala tea becoming quite popular all over world and excellent for preventing seasonal diseases, cough, cold, fever and influenza etc.

**Table 3: Components of Masala tea**

<table>
<thead>
<tr>
<th>Components</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloves</td>
<td>Antioxidant, anti-septic, local anesthetic, anti-inflammatory, Warming, carminative and anti-flatulent properties.</td>
</tr>
<tr>
<td>Cardamom</td>
<td>Cardamom (100g) contains energy (300 kcal), carbohydrates (68 g), protein (11 g), dietary fiber (28 g), Vitamin C, Thiamine, Vitamin B6, Riboflavin, Manganese, Iron, Magnesium, Zinc. Anti-inflammatory, Antispasmodic, Lower Cholesterol, Cure Asthma, Helps in Sore throat, Improve Blood circulation</td>
</tr>
<tr>
<td>Cinnamon</td>
<td>Cinnamon bark contains a natural antiseptic that have antibacterial, antifungal and anti viral activity Natural pain killer and reduce the inflammation It contain polyphenols which maintain metabolism, reduce blood sugar, improve digestion It increase the bioavailability of medicines</td>

<tr>
<td>Ginger</td>
<td>Gastroprotective; helps in gastritis, antioxidant, anti-inflammatory, antibacterial activity, act as appetizer It Protect the brain cells</td>
</tr>
<tr>
<td>Tulsi</td>
<td>Antibiotic, germicidal, fungicidal and disinfectant, Antidepressant, Antiinflammatory agent Cure respiratory disorders and bronchitis Antioxidant activity; helps in prevention of cancer and cardiovascular diseases Antiageing effects; fights with free radicals, Wound healing effects Active components: Camphene, Eugenol and Cineole</td>
</tr>
<tr>
<td>Black pepper</td>
<td>Cure respiratory disorders, coughs, constipation, indigestion, anemia, impotency and cardiovascular diseases</td>
</tr>
</tbody>
</table>

**2.4.1 Juice Blends**

A Juice blend of Pomegranate, Amla and green turmeric is consider to be excellent for post cancer operated patients and coronary heart diseases. The medicinal of pomegranate and amla is already mentioned in this article. The turmeric is also known for its meticulous antiseptic, antioxidant, anti-inflammatory, neuroprotective, cardioprotective, anti-ageing effects. Curcumin (generally 3%) is the main active ingredient in turmeric. It has powerful anti-inflammatory effects and is a very strong antioxidant. Curcumin also helps to relieve arthritis pain.

**Functional Soup:** Moringa dried/fresh leaves powder/paste soup amalgamated with sweet corn, green pea, ginger, black pepper and cardamom is commonly used by Indian population. Moringa leaves possess good quality proteins and several medicinal effects. Moringa is also rich in vitamin A, B and C and minerals like calcium, iron and phosphorous. Moringa helps in the prevention of diabetes and high blood pressure. Other components of soup also contribute to the excellent taste and medicinal value.

**2.5 Functional cereals**

Oat and barley, offer another alternative for the production of functional foods. Cereals can be used as fermentable substrates for the growth of probiotic microorganisms. Additionally, cereals can be applied as sources of nondigestible carbohydrates that besides promoting several beneficial physiological effects can also selectively stimulate the growth of *lactobacilli* and *bifidobacteria* present in the colon and act as prebiotics. Cereal constituents, such as starch, can be used as encapsulation materials for probiotics in order to improve their stability during storage and enhance their viability during their passage through the adverse conditions of the gastro-intestinal tract\[^{[3]}\].

Some functional cereal components such as beta-glucan, however, applied also in the dairy and bakery industries. Recent research has focused on the use of beta-glucans, in the manufacture of low-fat ice creams and yogurts. Incorporation of beta-glucans with other soluble dietary fiber, into low-fat dairy products can make their mouthfeel, scopability and sensory properties resemble those of full-fat products\[^{[4]}\].

In India, the lactating women take some traditional food supplements made from Rice/Wheat Flour, dry fruits, nuts and seeds, ghee (Clarified Butter), resins, herbs, brown/black pepper, coconut shreds, gums etc. These traditional supplements are not only energy rich but also provide minerals and vitamins.

**Table 4: Functions of Components of Traditional Food Supplements for lactating women**

2.6 Functional meat
Meat and its derivatives may also be considered functional foods to the extent that they contain numerous compounds thought to be functional. The idea of using food for health purposes rather than for nutrition opens up a whole new field for the meat industry. In addition to traditional presentations, meat industry can explore various possibilities, including the control of the composition of raw and processed materials via reformulation of fatty acid profiles or inclusion of antioxidants, dietary fiber or probiotics, etc [20].

3. Perspectives
The future viability and success of functional foods in the marketplace depend on several elements. The key issue is consumer acceptance of such products. For consumers to agree to pay the cost associated with functional foods, they must be convinced by its health claims through clear, truthful, and unambiguous messages.

4. References
