Abstract

The present investigation was aimed to development of chocolate coated legume bar with incorporation of different proportions of mothbean flour to date paste. To standardize the processing technology and analyze the characteristics of legume bar viz., sensory characteristics of legume bar. The formulation was carried out using germinated mothbean flour, date paste, chocolate in Preparation of legume bar. Different formulation were made with variation in germinated mothbean flour level from 0 to 30% for T0, T1, T2 and T3 respectively. Prepared legume bar then evaluated for organoleptic properties with respects to colour and appearance, flavour, texture, taste and overall acceptability using 9 point hedonic scale. The results revealed that legume bar prepared with supplementation of 20% germinated mothbean flour with 80% date paste (T2) secured highest score (i.e. 8.25) was superior as compared to rest of samples. It was seen that chocolate coating attracted all aged consumers. And was found that Legume bar prepared with mothbean and date paste was rich source of nutrients. Thus, mothbean can be well utilized as a functional ingredient for preparation of legume bar with good nutritional and date with medicinal value.

Keywords: Germinated mothbean flour, germination, dates, legume bar, energy bar chocolate coating, functional food, sensory evaluation

Introduction

Legumes are important nutritional source in developing countries. Chickpea, pigeon pea, lentil, urad bean, mung bean, lablab bean, moth bean, horse gram, pea grass pea, cowpea and faba bean are the major pulse crops grown in India. Legumes however, are said to have low protein and starch digestibility (Ghavidel and Prakash, 2007) [1]. Legumes are generally good sources of proteins and contain on an average from 18 to 25 percent. Among such legumes is mothbean. Its seeds contain 24.1% protein, 0.8% crude fibers, 1.3% fat, 3% ash, 9.6mg iron/100gm. (Fatema et al., 2011) [2].

Phytochemicals are the bioactive compounds that occur naturally in plants. Leguminous seeds are important source of proteins and source of natural antioxidants. Legumes contain a number of phenolic compounds such as flavonoids, phenolic acids, and tannins. There is a considerable interesting finding natural phytochemicals and antioxidants from plants due to their role in the treatment and/or prevention of various diseases. Trypsin inhibitors reduce the incidence of certain cancers and potent anti-inflammatory nature (Gupta et al., 2016) [3]. Mothbean consumption of 4 times or more week compared with less than once a week have been associated with 22% lower risk of coronary heart diseases. (Bazzano et al., 2001) [4].

The production of moth bean was 2.77 lakh tonnes in India during 2012–2015. Moth bean is commonly grown in arid areas of India and is consumed either as such after cooking or after germination and cooking. Moth bean is the unexploited legumes of the tropics and subtropics grown mostly under dry-land agriculture. The chemical composition is comparable with commonly cultivated legume. Like other legume this legume is deficient in methionine and tryptophan (Pawar and Ingle, 1988) [5].

The nutritive value of grain legumes depends primarily on their nutrient and the presence or absence of antinutritive and toxic factors (Ramakrishna et al., 2006) [6]. Some simple and inexpensive processing technique, such as soaking, germination, and cooking are highly efficient for the reduction of anti-nutritional factors and for improving its organoleptic quality (Abusing et al., 2009) [7].
Germination of cereals has been used for centuries to soften the kernel structure, to increase nutrient content and availability; to decrease the content of antinutritive compounds, and to add new flavors without knowing the biochemistry behind these phenomena. Barley malting is the most widely known controlled germination process, used to produce malt for brewing purposes and food applications (Norja et al., 2004) [8]. Germination, a complex process causing physical, chemical and structural changes in grains, has been identified as an inexpensive and effective technology for improving cereal quality. The germination process is characterized by the growth of the embryo of the grain, manifested by the rootlets growth and increase modification of the contents of the endosperm (De Pinho Ferreira Guine & dos Reis Correia, 2013) [9].

Energy bars are supplemental bars containing cereals and other high energy foods targeted at people who require quick energy but do not have time for a meal. They are different from energy drinks, which contain caffeine whereas bars provide food energy. Energy in food comes from all three main sources: fat, protein, and carbohydrates. A typical energy bar weighs between 45 and 80 g and is likely to supply about 200–300 Cal (840–1,300 kJ), 3–9 g of fat, 7–15 g of protein, and 20–40 g of carbohydrates (Tiwari, 2017) [10].

Fortification of plain and chocolate coated date bars resulted in an increase of protein, fat, fiber, ash, NA, K, CA, MG, P, Zn and all the essential amino acids. No difference was indicated in the control and fortified date bars which was stored up to 6 month (Sawaya et. al., 1983c) [11]. Kamel and Kramer (1977) [12] fortified dates prepared to form high protein date bars. The use of SCP in foods is, however limited to a certain level because of its high nucleic acid content.

Materials and Methods

Materials
The Raw material like Mothbeans, Dates, chocolate etc. will be procured from the local market of Parbhani. The proposed research was carried out in Department of Food process technology, College of Food Technology, VNMKV, Parbhani.

Methods

Germination of moth beans
Germination process is carried out by using method described by Mankotia and Modgil (2003). Moth bean grains were steeped in potable tap water for 12 h. Grain to water ratio was 1 : 3. The soaked grains were tied in muslin cloth and allowed to germinate at ambient temperature 25±20C. Grains were sprinkled with water. It took 24 hrs for grains to germinate.

Preparation of mothbean flour
When the sprouts were 1-2 cm long germinated grains were dried in cabinet drier at 50±30C for 12 h. The dried samples were milled to pass through a 40 mesh sieve. After grinding samples were kept in refrigerator in air tight plastic containers till further analysis was done.

Preparation of date paste
Seeds of the dates are removed. The seedless dates are blended with little amount of milk in mixer to form date paste.

Preparation of Chocolate paste
Dark chocolate compound from the market is melted to prepare chocolate paste.

Preparation of chocolate coated legume bar
Selected mothbeans were germinated for 24 h. Legume bar was prepared by using mothbean flour and date paste with different proportions Viz., 30:70, 20:80 and 10:90. The mixture of date paste and mothbean flour is slightly heated to form a thick mass for 2-3 min with continuous stirring for uniform mixing and moulded into suitable size and shape. After cooling, the bar is coated with liquid chocolate compound and freezed at 0-4°C. The prepared bar were subjected for sensory evaluation using 9 point hedonic scale.

Flow sheet for preparation of chocolate coated legume bar

1. Raw mothbeans
2. soaking of mothbeans for 12 h
3. germination within 24 h
4. removal of germs
5. preparation of mothbean flour by drying
6. preparation of date paste with milk
7. mixing of mothflour with date paste
8. Slight heating with continuously stirring for uniform mixing
9. Moulding
10. Cooling
11. Chocolate coating
12. Freezing and packaging

Results and Discussion

Organoleptic evaluation of energy bar
The different proportions of products (T1, T2, and T3) and control were made differently with different germinated mothbean flour, dates and chocolate to achieve a highly acceptable product. The organoleptic evaluation of energy bar carried out by a 10 semi trained panel member based on 9 point hedonic scale and the score were given by evaluating the sensory attributes for energy bar such color, appearence, texture, taste and overall acceptability which was compared with control sample and expressed in table 4.
Sensory analysis was carried out using 9-point hedonic scale. Sensory quality of whole chocolate coated legume bar on the basis of colour and appearance, flavour, texture, taste and overall acceptability are as shown in Table 2. All the samples are having same colour thus got same score (8.5). T2 sample got highest score in flavor and taste and least score to control sample (7.5, 7.0) respectively. While control sample got highest score in texture (8.6) and least to T3 (7.80). The overall acceptability of the legume bar has highest sensory score (8.25) for T2 followed by T1 (8.10), control sample (7.90) and at last T3 with least overall acceptability sensory score (7.80).

Conclusion
It can be concluded from results that energy bar prepared with 20:80 proportions of germinated mothbean flour to date paste was found to highly acceptable and recorded maximum score in case of all the sensory attributes. It could be concluded that good quality of energetic legume bar can be prepared using germinated mothbean and dates with chocolate coating enhances the sensorial as well as nutritional characteristics. Thus, all such health benefiting ingredients can be well utilized as a functional ingredient for preparation of legume bar with good nutritional and medicinal value which act as functional food product.
